```

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     expressing cell, preventing or treating obesity in a mammal, stimulating blood vessel regression in a mammal, enhancing drug delivery to the central nervous system, treating a demyelinating neurological disease, increasing vasopermeability in a mammal, enhancing adhesion of nonclassical cadherin-expressing cells, inhibiting synaptic stability in a mammal, or preventing pregnancy in a mammal. They can also be used for healing or reducing scar tissue, or enhancing adhesion of foreign tissue in a mammal. They can also be used for treating adhesion of foreign tissue arthritis, age-related macular degeneration, multiple sclerosis and diabetes. The products can also be used for treating e.g. psoriasis, and the products can also be used for detection and diagnosis and in bioreactors. NAY60592 to AAY64572 represent specifically claimed peptides, and AAY66573 to AAY64643 and AAZ33183 to AAZ33186 represent sequences used in the exemplification of the present invention.

ABG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention.

Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in dispositics, forensics, seen mapping, identification of mutations

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryottes the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL101840-ABL16175) and the encoded proteins
                                                                                                       New isolated nucleic acid
genes from Drosophila and

The invention discloses genomic DNA sequences (ABLIG176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins
                                                                                                                                                              useful in developmental biology and in elucidating cell signalli cell-cell interactions in higher eukaryotes for the development insecticides, therapeutics and pharmaceutical drugs. The inventidiscloses genomic DNA sequences (ABL16176-ABL36511), expressed Discourse (ABL01840-ABL16175) and the encoded proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New isolated nucleic acid genes from Drosophila and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              23-MAR-2000; 2000US-191637P

                                                                                                                                                                                                                                       The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL10184)-ABL16175) and the encoded proteins
                                                                                                                                                                   Sequence
                                                                                                                                                                                                                                                                                                                                                                               New isolated nucleic acid
genes from Drosophila and

                                                                                                                                  angiogenesis in a mammal, inducing apoptosis in a nonclassical cadherin-expressing cell, preventing or treating obesity in a mammal, stimulating blood vessel regression in a mammal, enhancing drug delivery to the central nervous system, treating a demyelinating neurological disease, increasing vasopermeability in a mammal, enhancing adhesion of nonclassical cadherin-expressing cells, inhibiting synaptic stability in a mammal, or preventing pregnancy in a mammal. They can also be used for e.g. enhancing or directing neurite outgrowth, facilitating wound healing or reducing scar tissue, or enhancing adhesion of foreign tissue in a mammal. They can also be used for treating e.g. psoriasis, age-related macular degeneration, multiple sclerosis and also be used for treating e.g. psoriasis.
                       arthritis, age-related macular degeneration, multiple sclerosis and diabetes. The products can also be used for detection and diagnosis are in bioreactors. AAY60592 to AAY64572 represent specifically claimed neptides. and AAY64573 to AAY64643 and AAZ33183 to AAZ33186 represent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          inhibiting adhesion of nonclassical-cadherin expressing cells in a mammal, enhancing delivery of a drug through the skin of a mammal, enhancing delivery of a drug to a tumour in a mammal, treating cancer in a mammal, inhibiting a mammal, inhibiting cancer in a mammal, inhibiting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New cadherin modulating agents, used for modulating nonclassical cadherin-mediated functions for treating e.g. cancers, obesity, rheumatoid arthritis, multiple sclerosis, diabetes or a neurolog
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   recognition (CAR) sequence. The MAs can be nonclassical cadherin-mediated functions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             comprising peptides which comprise a nonclassical carecognition (CAR) sequence. The MAs can be used for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention describes cadherin modulating agents comprising peptides which comprise a nonclassical cadherin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                rheumatoid
disease -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Blaschuk OW,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            S
          The present invention describes cadherin modulating agents (MA) comprising peptides which comprise a nonclassical cadherin cell adhesion recognition (CAR) sequence. The MAs can be used for modulating nonclassical cadherin-mediated functions. They can be used for e.g. inhibiting adhesion of nonclassical-cadherin expressing cells in a mammal, enhancing delivery of a drug through the skin of a mammal, cenhancing delivery of a drug through the skin of a mammal, inhibiting angiogenesis in a mammal, inhibiting metastasis of a cancer in a mammal, inhibiting angiogenesis in a mammal, inducing apoptosis in a nonclassical cadherin-expressing cell, preventing or treating obesity in a mammal, stimulating blood vessel regression in a mammal, enhancing drug delivery to the central nervous system, treating a demyelinating neurological disease, increasing vasopermeability in a mammal, enhancing synaptic stability in a mammal, or preventing pregnancy in a mammal. They can also be used for a mammal, or preventing pregnancy in a mammal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Matches

                                                                                                                                                                                                                                                                                                                                                          nervous system, however it is particularly involved in the inflammatory lesions associated with acne vulgaris. A method for detecting the presence or absence of P. acnes in a patient comprises contacting a sample with a binding agent that binds to the proteins of the invention and determining the amount of bound protein in the sample. The polypeptides may be used as antigens in the production of antibodies specific for P. acnes proteins. These antibodies can be used to downregulate expression and activity of P. acnes polypeptides and therefore treat P. acnes infections. The antibodies may also be used as diagnostic agents for determining P. acnes presence, for example, by enzyme linked immunosorbent assay (ELISA).

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Propionibacterium acnes polypeptides and nucleic acids useful for vaccinating against and diagnosing infections, especially useful for treating acne vulgaris -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           21-APR-2000; 2000US-199047P.

                  megakaryocyte colony stimulating factor (meg-CSF). Exon I contains CC the initiating methionine, and encodes a classical mammalian protein secretion signal sequence. The sequence encoding the original meg-CSF includes exons II-IV and is thought to terminate in the region between amino acid residues 134 - 147. The primary transcript of this gene camino acid residues 134 - 147. The primary transcript of this gene coding a different ways to yield a family of mRNA's each created to the activity of the factor and are also implicated in the stability, folding and processing of the molecule. These exons are cytokines. Exons V - XII are believed to be implicated in the processing or folding of the appropriate structure of the resulting calso the color, ie. one or more of these exons may contain sequences which calculated in combinations of alternatively spliced exons from this sequence, with the exons spliced together in differing orders to form different with cheevers of the wee failty.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The sequence covered by exons II, III and IV encodes megakaryocyte stimulating factor (MSF). This sequence was used to produce MSF as a fusion protein with thioredoxin. This sequence was derived from
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New human mega-karyocyte stimulating factors - for treating immune deficiencies, cancer, exposure to radiation or drugs bacterial and viral infections, etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               MSF-precursor (see also AAR26050).
The precursor cDNA sequence contains sequences derived from human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Disclosure; Fig 3; 87pp; English.

complementary strand of a polynucleotide which comprises a 5'-end complementary to the comprising a sequence complementary to the comprises a 1'-end comprises a 5'-end complementary to a complementary to a polynucleotide which comprises a 3'-end sequence complementary to a comprises at least 15 nucleotides and the combination of the 5'-end sequence', a'-end sequence is selected from those defined in the specification. The primers are useful for synthesising polynucleotides, are therapy and compared the specification. The primers are useful for synthesising polynucleotides, are compared to the specification of the specification and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers allow obtaining of the full-length cDNAs easily without any specialised methods. AAH31628 and compared to the compared to the compared to compared to the compared to com

                                                                                                                                                                                                                                                                                                                                                                    The clone was isolated from a human placenta lambda phage DNA library. The sequence can be inserted into expression vectors the prodn. of recombinant meg-CSF. The protein is used to trableeding disorders and platelet deficiencies.

                                                                                                                                                                                                                                                                                             T 15
                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a stimulating factor, HAPO, with the effect of promoting growth of haemopoietic stem ancestral cells and vascular endothelial cells. HAPO is characterised using several pairs of primers specific for HAPO DNA to make a series of gene segments by PCR amplification. An antibody specific to the HAPO polypeptide can be used in the treatment and prevention of haemopoietic and vascular diseases. This sequence represents the HAPO polypeptide of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a recombinant protein having a 341 amino acid sequence fully defined in the specification, or its mutant in which at least one amino acid is deleted, substituted or added, but which retains the galectin activity. The protein is useful for studying mechanisms of fish immunity and for diagnosing fish diseases. The galectin proteins are involved in inhibition of cell adhesion, inflammation, metastasis of tumour cells, T cell movement, and apoptosis. The present sequence

                    AAR83405-R83419 represent mutations of the endoglucanase of Humicola insolens (the wild type sequence is represented by AAR83398). Endoglucanase is a Family 7 cellulase. These cellulases can be used for soil removal in detergents, or in fabric softeners. They can also be used for colour clarification of textile fabrics, for preventing backstaining in fabric washing, for textile soil removal and io-polishing, for de-inking used paper, for paper pulp drainage improvement and defibration or debarking. The proteins can also be used in the baking and wine and juice industry or for animal feeds. The mutated sequences have improved fibre wall penetrating ability, and can provide more efficient degradation of cellulosic materials while not
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      soil removal in detergents, or in fabric softeners.                                                                                                                                                 AAR83405-R83419 represent mutations of the endoglucanase of Humicola insolens (the wild type sequence is represented by AAR83398). Endoglucanase is a Family 7 cellulase. These cellulases can be used for soil removal in detergents, or in fabric softeners. They can also be used for colour clarification of textile fabrics, for preventing backstaining in fabric washing, for textile soil removal and bio-polishing, for de-inking used paper, for paper pulp drainage improvement and defibration or debarking. The proteins can also be used in the baking and wine and juice industry or for animal feeds. The mutated sequences have improved fibre wall penetrating ability, and can provide more efficient degradation of cellulosic materials while not reducing the tensile strength of fabrics.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Modified Family 7 cellulase enzymes - used for soil detergent compsns. or in fabric softener compsns.

                                                                                                                                                                                                                AAR83405-R83419 represent mutations of the endoglucanase of Humicola insolens (the wild type sequence is represented by AAR83398). Endoglucanase is a Family 7 cellulases. These cellulases can be used for soil removal in detergents, or in fabric softeners. They can also be used for colour clarification of textile fabrics, for preventing backstaining in fabric washing, for textile soil removal and bio-polishing, for de-inking used paper, for paper pulp drainage improvement and defibration or debarking. The proteins can also be used in the baking and wine and juice industry or for animal feeds. The mutated sequences have improved fibre wall penetrating ability, and can provide more efficient degradation of cellulosic materials while not reducing the tensile strength of fabrics.

                                                                                                                                                                                                                                                                                                                                                          AAR83405-R83419 represent mutations of the endoglucanase of Humicola insolens (the wild type sequence is represented by AAR83398). Endoglucanase is a Family 7 cellulase. These cellulases can be used for soil removal in detergents, or in fabric softeners. They can also be used for colour clarification of textile fabrics, for preventing backstaining in fabric washing, for textile soil removal and bio-polishing, for de-inking used paper, for paper pulp drainage improvement and defibration or debarking. The proteins can also be used in the baking and wine and juice industry or for animal feeds. The mutated sequences have improved fibre wall penetrating ability, and can provide more efficient degradation of cellulosic materials while not reducing the tensile strength of fabrics.
Endoglucanase; humicola insolens; family 7 cellulase; soil removal; detergent; fabric softener; defibration; debarking; bio-polishing; de-inking; paper pulp drainage; animal feed; fabric washing.

Endoglucanase is a Family 7 cellulase. These cellulases can be used for soil removal in detergents, or in fabric softeners. They can also be used for colour clarification of textile fabrics, for preventing backstaining in fabric washing, for textile soil removal and bio-polishing, for de-inking used paper, for paper pulp drainage improvement and defibration or debarking. The proteins can also be used in the baking and wine and juice industry or for animal feeds. The mutated sequences have improved fibre wall penetrating ability, and can provide more efficient degradation of cellulosic materials while not
                                                                                      Endoglucanase; humicola insolens; family 7 cellulase; soil removal; detergent; fabric softener; defibration; debarking; bio-polishing; de-inking; paper pulp drainage; animal feed; fabric washing.

Endoglucanase is a Family 7 cellulases. These cellulases can be used for soil removal in detergents, or in fabric softeners. They can also be used for colour clarification of textile fabrics, for preventing backstaining in fabric washing, for textile soil removal and bio-polishing, for de-inking used paper, for paper pulp drainage improvement and defibration or debarking. The proteins can also be used in the baking and wine and juice industry or for animal feeds. The mutated sequences have improved fibre wall penetrating ability, and can provide more efficient degradation of cellulosic materials while not

Endoglucanase is a Family 7 cellulase. These cellulases can be used for Endoglucanase is a Family 7 cellulase. These cellulases can be used for solour clarification of textile fabrics, for preventing used for colour clarification of textile fabrics, for preventing backstaining in fabric washing, for textile soil removal and bio-polishing, for de-inking used paper, for paper pulp drainage improvement and defibration or debarking. The proteins can also be used in the baking and wine and juice industry or for animal feeds. The mutated sequences have improved fibre wall penetrating ability, and can provide more efficient degradation of cellulosic materials while not
                 Modified Family 7 cellulase enzymes - used for soil removal detergent compsns. or in fabric softener compsns.

Endoglucanase is a Family 7 cellulase. These cellulases can be used for soil removal in detergents, or in fabric softeners. They can also be used for colour clarification of textile fabrics, for preventing backstaining in fabric washing, for textile soil removal and bio-polishing, for de-inking used paper, for paper pulp drainage improvement and defibration or debarking. The proteins can also be used in the baking and wine and juice industry or for animal feeds. The mutated sequences have improved fibre wall penetrating ability, and can provide more efficient degradation of cellulosic materials while not reducing the tensile strength of fabrics.
                    AAR83405-R83419 represent mutations of the endoglucanase of Humicola insolens (the wild type sequence is represented by AAR83398). Endoglucanase is a Family 7 cellulase. These cellulases can be used soil removal in detergents, or in fabric softeners. They can also be used for colour clarification of textile fabrics, for preventing backstaining in fabric washing, for textile soil removal and

                                                                                   This sequence represents endoglucanase, a family 7 cellulase isolated from Humicola insolens. The sequence was mutated to give the sequences represented by AAR83405-R83419. The mutated cellulases can be used for soil removal in detergents, or in fabric softeners. They can also be used for colour clarification of textile fabrics, for preventing backstaining in fabric washing, for textile soil removal and bio-polishing, for de-inking used paper, for paper pulp drainage improvement and defibration or debarking. The proteins can also be used in the baking and wine and juice industry or for animal feeds. The mutated sequences have improved fibre wall penetrating ability, and can provide more efficient degradation of cellulosic materials while not reducing the tensile strength of fabrics.
                                                                                                                                                                                                                                                                                      Claim
                                                                                                                                                                                                                                                                                                               Modified Family 7 cellulase enzymes - used for soil detergent compsns. or in fabric softener compsns.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Endoglucanase; humicola insolens; family 7 cellulase; soil removal; detergent; fabric softener; defibration; debarking; bio-polishing; de-inking; paper pulp drainage; animal feed; fabric washing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       improvement and defibration or debarking.                                                                                                                                                                                                           AAR83405-R83419 represent mutations of the endoglucanase of Humicola insolens (the wild type sequence is represented by AAR83398). Endoglucanase is a Family 7 cellulase. These cellulases can be used for soil removal in detergents, or in fabric softeners. They can also be used for colour clarification of textile fabrics, for preventing backstaining in fabric washing, for textile soil removal and bio-polishing, for de-inking used paper, for paper pulp drainage improvement and defibration or debarking. The proteins can also be used in the baking and wine and juice industry or for animal feeds. The mutated sequences have improved fibre wall penetrating ability, and can provide more efficient degradation of cellulosic materials while not reducing the tensile strength of fabrics.

They can also be used for colour clarification of textile fabrics, for preventing backstaining in fabric washing, for textile soil removal and bio-polishing, for de-inking used paper, for paper pulp drainage improvement and defibration or debarking. The proteins can also be used in the baking and wine and juice industry or for animal feeds. The mutated sequences have improved fibre wall penetrating ability, and can provide more efficient degradation of cellulosic materials while not reducing the tensile strength of fabrics.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          AAR83405-R83419 represent mutations of the endoglucanase of Humicola insolens (the wild type sequence is represented by AAR83398). Endoglucanase is a Family 7 cellulase. These cellulases can be used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Endoglucanase; humicola insolens; family 7 cellulase; soil removal; detergent; fabric softener; defibration; debarking; bio-polishing; de-inking; paper pulp drainage; animal feed; fabric washing.

They can be used for used for colour clarification of textile fabrics, for preventing backstaining in fabric washing, for textile fabrics, for preventing backstaining in fabric washing, for textile soil removal and bio-polishing, for de-inking used paper, for paper pulp drainage improvement and defibration or debarking. The proteins can also be used in the baking and wine and juice industry or for animal feeds. The mutated sequences have improved fibre wall penetrating ability, and can provide more efficient degradation of cellulosic materials while not reducing the tensile strength of fabrics.
                                                                                                                                                                                                                    Endoglucanase; humicola insolens; family 7 cellulase; soil removal; detergent; fabric softener; defibration; debarking; bio-polishing; de-inking; paper pulp drainage; animal feed; fabric washing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     AAR83405-R83419 represent mutations of the endoglucanase of Humicola insolens (the wild type sequence is represented by AAR83398). Endoglucanase is a Family 7 cellulase. These cellulases can be used

Singular answer in the second by AAR83398). Singular answer in detergents, or in fabric softeners. They can also be used for colour clarification of textile fabrics, for preventing backstaining in fabric washing, for textile fabrics, for preventing backstaining in fabric washing, for textile fabrics, for preventing backstaining in fabric washing, for textile fabrics, for preventing backstaining in fabric washing, for textile fabrics, for preventing backstaining in fabric washing, for textile fabrics, for preventing backstaining in fabric washing, for textile fabrics can also be used in the baking and defibration or debarking. The proteins can also be used in the baking and wine and juice industry or for animal feeds. The mutated sequences have improved fibre wall penetrating ability, and can provide more efficient degradation of cellulosic materials while not reducing the tensile strength of fabrics.

They can also be used for colour clarification of textile fabrics, for preventing backstaining in fabric washing, for textile soil removal and bio-polishing, for de-inking used paper, for paper pulp drainage improvement and defibration or debarking. The proteins can also be used in the baking and wine and juice industry or for animal feeds. The mutated sequences have improved fibre wall penetrating ability, and can provide more efficient degradation of cellulosic materials while not reducing the tensile strength of fabrics.
                                                  Detergent compsn. contg. two cellulase coremoving soil particles and the second coclarification, useful in laundry compsns.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    retaining-type activity, pref. having a catalytic activity on cellotriose at pH 8.5 corresponding to kcat of at least 0.01 s<-1>, and capable of particulate soil removal; and 2) a second cellulase component having multiple domains comprising at least one non-catalytic domain attached to a catalytic domain, pref. having a catalytic activity on Red Avicel 7.5 per 1 mg of cellulase protein higher than 10<-4> IU and being capable of colour clarification, where at least one of the cellulase components is a single (recombinant) component, are useful for cleaning and colour clarification of cellulose-containing fabrics. The first cellulase component can be an endoglucanase which is immunoreactive with an antibody raised against a highly purified ~50 kD endoglucanase derived from Fusarium oxysporum, DSM 2672, and is esp. the present sequence, designated EG I-F.
                                            A novel one-step process for combining desizing and 'stone-washing' of dyed denim involves treatment with an amylolytic enzyme in combination with a first abrading monocomponent endoglucanase, such as the EG V type cellulases of Humicola insolens DSM 1800 (AAW17926) or Fusarium oxysporum DSM 2672 (AAW17927), and a second streak-reducing monocomponent endoglucanase, such as the endoglucanase of H. insolens DSM 1800 (AAW17928). Improved colour uniformity and distribution and stone-wash quality are obtd. The denim may additionally be treated with a thermostable lipolytic enzyme.
                                                                                                                                                                                                                                                                                                                                                                                                                              Combined desizing and stone-washing of with an amylolytic enzyme, an abrading

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Alzheimer's, Parkinson's disease, Huntington's disease; haemostatic; chemokinetic; thrombolytic; drug screening: arthroic lateral sclerosis; Shy-Drager Syndrome; chemotactic; leukaemia.
                                                                                                                                                                                                                                               immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral neuropathy and localised neuropathies and central nervous system diseases, such as
                                                                                                                                                                                                                                                                                                                                        The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful
                                                                                                                   assays
                                                                                                                                                    Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, Activin/inhibin activity, chemotactic/chemokinetic activity, haemostatic activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel nucleic acids and such as central nervous

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                S
                                                                                                                                               cc from Fusarium oxysporum. Mutated versions of this sequence are creferred to in claims 16, 17 and 18. These mutations include N890, N2470, H123N, T385N, Q399N, E202A, S37W, P39W, M142E, K217A, K218T, R245G, I310D, E150Q, E334K and M198D. However the numbering of these mutants appears to be based on the numbering of the Humicola insolens compared to the based on the numbering of the mutants of this compared to the created. This cellulase (and mutated versions of it) can be used for soil removal in detergents, or in fabric softeners. They cc can also be used for colour clarification of textile fabrics, for preventing backstaining in fabric washing, for textile soil removal and cc provide more and defibration or debarking. The proteins can also be used cc in the baking and wine and juice industry or for animal feeds. The cutated sequences have improved fibre wall penetrating ability, and can cc reducing the tensile strength of fabrics.

Beta-glucanase polypeptide is useful for the manufacture of a medicament for treating hyperlipaemia, high serum cholesterol and triglyceride levels. Beta-glucanase polypeptide are useful for treating fungal or plant materials (plant pulp, plant extracts), edible foodstuffs or ingredients, or fabrics, textiles or clothes containing plant materials. Beta-glucanase polypeptide is useful for reducing the viscosity of a plant material, for cleaving beta-p-glucanase polymers in the plant material, and for processing plant pulp, juice or extract. by incubating the pulp, juice or extract. Beta-glucanase polypeptide is applicable in brewing, distilling, biomethanation, dental hygiene, leather-treatment, paper manufacture, textile treatment or manufacture, baking or bread making, washing or detarget treatment treatment from the plant for several feed to the pulp of the plant material feed manufacture.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New polypeptide for treating hyperlipemia and/or high serum cholesterol and triglyceride levels, comprises the beta-glucanase protein obtainable from Talaromyces fungus -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       WPI; 2001-648392/74.

                                                                                                                                                                                                                                                                                                                                                                                                     the invention. The detergent comprises an anion surfactant, a cellulase enzyme and a cellulase stabilising amount of an amine of the formula R1R2R3N; where R1 and R2 are independently H or a C2-C9 alkyl chain, and R3 is a C2-C9 alkyl chain or cyclohexyl or cyclopentyl or cycloheptyl. The amine prevents the cellulase enzyme from becoming degraded. The composition is used as a liquid detergent, and has long term stability, it is applicable to the protection of an cellulase and can be used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This sequence represents an endoglucanase enzyme protein sequence. The enzyme is a cellulase enzyme used in the liquid detergent composition of the invention. The detergent comprises an anion surfactant, a cellulase

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      A novel one-step process for combining desizing and 'stone-washing' of dyed denim involves treatment with an amylolytic enzyme in combination with a first abrading monocomponent endoglucanase, such as the EG v type cellulases of Humicola insolens DSM 1800 (AAW17926) or Fusarium oxysporum DSM 2672 (AAW17927), and a second streak-reducing monocomponent endoglucanase, such as the endoglucanase of H. insolens DSM 1800 (AAW17928). Improved colour uniformity and distribution and stone-wash quality are obtd. The denim may additionally be treated with a thermostable lipolytic enzyme.

This is the amino acid sequence of the cellulolytic enzyme EGI, without a cellulose binding domain (CBD). The enzyme is used in a laundry detergent and/or fabric care composition, which is made from this catalytically active EGI amino acid sequence linked to an amino acid sequence of a CBD. The modified EGI enzyme of the invention is derived from Humicola insolens or Trichoderma resei, has an approximate molecular weight of 50kD, an isoelectric point of 5.5 and contains the EGI 415 amino acid sequence linked to a CBD. The enzyme is useful in laundry detergent and/or fabric care compositions which can be used for cleaning, fabric stain removal, fabric whiteness maintenance; anti-bobbling, depilling, fabric stotiness, colour appearance and fabric anti-wear properties and benefits A detergent made with the enzyme has improved cleaning benefits, without any undesirable impact on the fabric, even at high enzymatic

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Score

Sequence 910, Application US/09187859A

Patent No. 6358920

GENERAL INFORMATION:
APPLICANT: Blaschuk, Orest W.
APPLICANT: Gour, Barbara J.

TITLE OF INVENTION: COMPOUNDS AND METHODS FOR MODULATING NONCLASSICAL
TITLE OF INVENTION: CADHERIN-MEDIATED FUNCTIONS

PILE REFERENCE: 100086.407C1

CURRENT APPLICATION NUMBER: US/09/187,859A

CURRENT FILING DATE: 1998-11-06

NUMBER OF SEQ ID NOS: 4052

SOPTWARE: Patentin Ver. 2.0

SEQ ID NO 910

LENGTH: 5

TYPE: PRT
ORGANISM: Artificial Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match
